### **TITLE: ASSIGNMENT 2**

**Instructions to students:**

- This is a Group/Individual Assignment.
- Complete this cover sheet, table of contents and attach all your findings.
- Use line spacing 1.5 and font Times New Roman with font size 12.

**Student declaration:**

*We declare that:*

- *We understand what is meant by plagiarism*
- *The implications of plagiarism have been explained to us by our lecturer*
- *This assignment is my/our own work.*

**Name (Student ID) (E-mail)**

**Signature**

**ABER (abermofasser@gmail.com)**

**Aber**

2	Section B	7

# SECTION A

a.

Some reasons to perform things client-side:

- For lower load on servers
- Faster visual feedback
- Validating input
- For cookies
- Dynamic page performance
- Interact with temporary storage, and local storage (Cookies, localStorage)

Some reasons to perform things server-side:

- Faster access to server-side data
- For search engines
- For RSS information updates
- Better management of bandwidth to client
- Easier to secure and control access to data server-side than client-side

b.

A web server uses HTTP (HyperText Transfer Protocol) to serve files that create webpages to users upon their request.

Apache, IIS and LiteSpeed are examples of web servers

According to (developer.mozilla.org, n.d.),

“To publish a website, you need either a static or a dynamic web server.

A static web server, or stack, consists of a computer (hardware) with an HTTP server (software). We call it "static" because the server sends its hosted files "as-is" to your browser.

A dynamic web server consists of a static web server plus extra software, most commonly an *application server* and a *database*. We call it "dynamic" because the application server updates the hosted files before sending them to your browser via the HTTP server.”

According to (Wikipedia),

Web servers are not only used for serving the World Wide Web. They can also be found embedded in devices such as printers, routers, webcams and serving only a local

network. The web server may then be used as a part of a system for monitoring or administering the device in question. This usually means that no additional software has to be installed on the client computer, since only a web browser is required (which now is included with most operating systems).

## C.

### **Apache**

Apache is a web server software that is free, open source and cross platform. Its developed and maintained by a community of developers. The original author is Robert McCool and it was initially released in 1995.

It was based originally on the NCSA HTTPd server and development of Apache began in early 1995 after work on NCSA code stalled. Apache played a role in the growth of the World Wide Web and it overtook the NCSA HTTPd as the dominant HTTP server. Since April 1996, it has remained popular. Apache is written in C language and XML.

It is cross platform and the software is available for Windows, Unix, Mac OS X, Netware, Linux, etc.

According to (ntchosting, n.d.),

“Some of the capabilities supported by the server include support for CGI (Common Gateway Interface) and SSI (Server Side Includes), URL redirection,

automatic directory listings, user authentication, anonymous user access, loading modules support, HTTP header metafiles, proxy caching abilities, etc.”

The core functionality and/or capability of Apache can be extended by the use of modules. According to wikipedia,

“These can range from server-side programming language support to authentication schemes. Some common language interfaces support Perl, Python, Tcl, and PHP. Popular authentication modules include mod\_access, mod\_auth, mod\_digest, and mod\_auth\_digest, the successor to mod\_digest. A sample of other features include Secure Sockets Layer and Transport Layer Security support (mod\_ssl), a proxy module (mod\_proxy), a URL rewriting module (mod\_rewrite), custom log files (mod\_log\_config), and filtering support (mod\_include and mod\_ext\_filter).”

## PHP

PHP (Hypertext Processor) is a popular server-side scripting language. It first appeared on June, 1995. It is used for the purpose of web development and enhancement of the web development. It can be used for dynamic websites. It works on major operating systems like Windows, MacOS and Linux.

According to (Wikipedia),

“PHP code may be embedded into HTML or HTML5 markup, or it can be used in combination with various web template systems, web content management systems and web frameworks. PHP code is usually processed by a PHP interpreter implemented as a module in the web server or as a Common Gateway Interface (CGI) executable. The web server software combines the results of the interpreted and executed PHP code, which may be any type of data, including images, with the generated web page. PHP code may also be executed with a command-line interface (CLI) and can be used to implement standalone graphical applications.”

## mySQL

mySQL is an open source relational database management system based on SQL (Structured Query Language). The original author is the company, MySQL AB. It is written in C and C++ language.

According to (webopedia.com, n.d.),

MySQL is most commonly used for Web applications and for embedded applications and has become a popular alternative to proprietary database systems because of its speed and reliability. MySQL can run on UNIX, Windows and Mac OS.

It is popular for web hosting applications and mySQL is also used in websites such as Facebook and Twitter.
